New features are being incorporated into AutoCAD as they are introduced in new releases. As such, new features may not be available in all releases of AutoCAD or may only be available in a limited subset of release years. New features in the current release Previous releases Since version 9, AutoCAD has had the ability to export to AutoCAD drawings as layers. This was introduced in AutoCAD V2.0, with the name of the feature being "Export Layers". The feature was also present in AutoCAD 2002 but it did not offer the layer feature. Moves and links AutoCAD has the ability to create or import "Moves" and "Links". These allow for objects to be moved around from one drawing to another. This feature is most useful in moving objects from one drawing to another on a website. These files are created and imported as standard drawing files. Transparency AutoCAD 2007 and earlier have been able to import transparency for layer, edit, block, and most other object types. Search and replace AutoCAD 2009 introduced a search and replace function to allow the user to edit and replace text in a drawing. Custom properties Version 2008 introduced the ability to have custom properties on objects such as the ability to include comments on objects. 2016 On May 27, 2016 AutoCAD 2016 (v17.0) was released with a new feature called Object Layout. This allows the user to set properties such as height, width, placement, radius, outline, and others. 2018 On April 5, 2018 AutoCAD 2018 (v19.0) was released with a new feature called Object Layout. This allows the user to set properties such as height, width, placement, radius, outline, and others. Link management Since AutoCAD 2013 (version 15.2), users have the ability to manage links in a drawing. 2017 On March 21, 2017 AutoCAD 2017 (v16.1) was released. This release included the ability to define the group of links in a view port. 2019 On February 11, 2019 AutoCAD 2019 (v19.1) was released with the ability to create, edit, and delete link groups. Texture mapping AutoCAD 2016 introduced the ability to define texture maps for use with certain features. It was part of the advanced feature called "surface a1d647c40b

Now type "design". A windows will open and show you the first design which is saved with your key Select the design and close it You can use this saved file as a new design. Q: Identify parts of data source that require case-insensitive SQL I have inherited a legacy SQL Server database and need to update the case sensitivity settings for SQL Server's Text-Identification. The existing data seems fine and I don't anticipate any issues with changes to the collation, I just need to make sure it doesn't cause any issues elsewhere. I've changed the collation to something like Russian_Pol_CI_AS and I've confirmed that the data is still sorting correctly, but it seems to be ignoring the case-sensitivity settings. If I sort on PersonID and then PersonName they are appearing in the same order, regardless of the case. I've added a few records and then sorted, and as expected PersonID and PersonName don't appear to be in the same order. Is there a way of confirming that the Text-Identification is actually ignoring the collation settings? I want to be absolutely sure that it isn't being affected by anything else in the database, and I have never encountered a situation where Text-Identification did not apply case-sensitivity to columns. A: First, the collation doesn't determine the order of things in the database, collations determine the sorting of strings, not the order of the items in the database. Second, TextIdentification isn't a setting that determines case-sensitivity in and of itself, it's a setting on how text is interpreted. To determine if TextIdentification is actually working, you need to actually compare the text being returned by TextIdentification to the text you expect it to be and make sure that they match. It's quite easy to do so, using the string_compare() function. To see the difference between case-sensitive and case-insensitive text
