Clinical guidelines are increasingly being used in clinical practice to achieve a higher level of evidence-based medicine. However, the development of clinical guidelines is an empirical process that requires good organisation and experience. This paper describes the process followed by our institution in the development of guidelines for the treatment of hypertension, and discusses the components of good practice. The process of the guideline development started with a scoping review to provide an initial overview of the available literature. The scope of the guidelines was defined based on this review and on the recommendations of a panel of experts. The methodology used in the development of the guidelines was the OMERACT 10 development process. We selected two clinical topics, the evaluation of antihypertensive treatment in the elderly and cardiovascular events in diabetes. The search identified 1527 abstracts and 57 full-text papers; this was reduced to 15 and 13 papers respectively, which were identified for evaluation by the panel of experts. The development of clinical guidelines for the treatment of hypertension requires the involvement of several relevant professionals in the target population, the production of scientific literature that will be considered in the development of the guidelines, and the consensus of an expert panel. The process provides an initial approach to the formation of the guidelines, which should subsequently be refined, thus providing a robust set of recommendations that are applicable in clinical practice.

Density-Independent Electron Temperature in a Strongly Driven Electron-Gas Plasma. It is known that strong-field excitation of an electron-gas plasma can lead to a redistribution of the electron temperature. Here, we show that this effect can be described by a simple model, in which the redistribution of the electron temperature is linked to a simple, density-independent, temperature increase of the thermalized electrons. The transition from weak to strong excitation is quantified by an effective field for which the above model applies. The experimental data presented here cover both
