I have a.bat script that runs a C# code. It looks something like this: "C:\Program Files (x86)\Microsoft Visual Studio\2017\Enterprise\Common7\IDE\devenv.exe" "/rootsuffix Exp" "C:\Temp\mycode.csproj" However, I have a couple of issues. The above code runs the IDE with the right settings, but not the right solution configurations. For example, my project has 2 configurations: Release and Debug. When I open up a solution, the Debug configuration is selected. Also, the correct directory is opened and not the bin directory. The above code runs the IDE with the right settings, but without compiling the C# code. How can I run the IDE with the above settings, with compiling the code? I have tried the following: Removing the /rootsuffix Exp from the devenv.exe command, but it doesn't make a difference. Removing the "C:\Temp\mycode.csproj" argument, but that's invalid. A: It's easier to pass the arguments to the program manually. Use following command with C# code to run in release mode: "C:\Program Files (x86)\Microsoft Visual Studio\2017\Enterprise\Common7\IDE\devenv.exe" "/rootsuffix Exp" "/ProjectName" "C:\Temp\mycode.csproj" /ProjectName should contain the name of your.csproj file. Similarly, in debug mode, pass /debugexe switch instead of /rootsuffix Exp. References: devenv.exe /rootsuffix /deb ca3bfb1094

Start Autocad and load a few sheets of paper. Pick one of the sides of the paper that shows through the top of the drawing. Grab the RTA Tool Box (the big menu), and look for the RTAHELP command on the far right. This is the 4 key tool option: "Rotate a portion of the drawing". Left click to create the primary key (in this case the paper). Right click to create the secondary key (in this case the right side of the paper). Double click on the key to select it. Press Enter to activate the tool. Note that you can also double click in the drawing (and you can drag to create multiple key sections) What's next? Create a bunch of key sections. One at a time, you can activate the key section, rotate the drawing, and then double click to delete the tool from the keyboard. Repeat this action for a few key sections. Test your key section so that it works as expected. Note that this process uses the main drawing window (not a separate drawing). Test your key section on a smaller copy of the main drawing window. Start the process again, create new key sections. Save a new copy of the main drawing and load that copy on the computer so you can start over. At any time, save the copy of the main drawing so you can reload it later. Are you ready to use the keygen to save and load Autocad drawings and work with multiple drawings? Troubleshooting If Autocad is not responding for you, here are a few troubleshooting tips. * You may not be working with a clean Autocad setup. In Autocad, when you open a drawing, it is saved in a temporary file and not saved in your Autocad library. Clean up the temporary file before you begin, and then delete the temporary file when you're finished. You should never have temporary files in the Autocad library. * Another solution is to change your settings so that the drawing is saved to your library each time you create a new drawing. * Your hardware is too slow to process the drawing. Check to make sure your video card is performing as expected. * You're not working from the desktop, but from the laptop. * If
