The menu in the upper left corner is at the top of most windows. There you have the option to export/save, which saves the file to the computer or export the file to a format (other image editing programs). There are also various quality and size options available. The next option, layers, allows you to visually edit the image and edit between layers. The layers are stored within the file under tabs so they are easily accessible. Next is the histogram, which provides information about the area of the image that is light and shadow. This is useful in evaluating whether the image is in color balance. Import/export options are the last tab. They allow you to convert the file into different formats, such as e-mail, pdf, and more. Moving on to the bottom right is the adjustment tab, which contains some of Photoshop's tools for altering the picture. The next to the bottom right corner is the type option, where you can change the font, text size, and different color styles. The bottom toolbox in the bottom corner has most of the tools that most people would use. There is also an eraser tool, which deletes lines, shapes, and text. Creating and Using Gradients The next element of the image is the gradient. Gradients are used for mixing colors. They create the appearance of one color transitioning into another. It is very important to note that they use transparency so you can see both colors. To create and use a gradient, first make sure the layer you want to edit is selected. Select New Gradient from the Tools menu, then choose a color for your gradient. Then simply move the cursor over the place you want to see the graded color and press Enter or Click. Another way of using a gradient is to first create a selection with the Marquee tool. Then fill the selection with black. Hold Shift and Alt/Option (Windows) or Control and Shift (Mac) and click within the selection to create a gradient. This is helpful for fading a color from a specific point to another. Gradients are also very useful for creating specific backgrounds. They can be used as edges or borders, for example, for comics. Cleaning and Desaturating Images One of the easiest ways to clean and desaturate an image is to use the Spot Healing Brush. With the Spot Healing Brush, you select an area to remove blemishes

Another highlight was the increase in deaths from gunshot wounds in 2017, from 115 to 120 — an increase of 6 percent, according to the report, which had a total population of nearly 5 million people. That means the rate was 1.2 per 100,000 population. In 2016, the rate was 1.1, according to the 2016 report. Of the more than 3,100 deaths in Minnesota in 2017, 1,025 were from homicides. That's an increase of 6.3 percent over the 2016 rate, according to the report. In 2016, there were 988 homicides — an increase of 6.7 percent over the previous year. Thirty-nine of the homicides were reported as an intentional homicide, which is up from 34 the previous year. The 2017 report shows increases in crime against women. In 2017, there were 234 reported sexual assaults, up from 220 the previous year. That's an increase of nearly 7 percent. There were also increases in arson, drug abuse, physical abuse and motor vehicle assaults. The report showed a decline in the number of suicides. The number of suicides was lower in 2017, with 302 people taking their own life, compared to 319 last year. "In Minnesota, and across the country, suicide is an ongoing public health crisis," said Dr. Phil Smith, Medical Examiner-Coroner for Anoka County. "We're encouraging Minnesotans to reach out to trusted sources for assistance should they be feeling a sense of hopelessness or unable to cope with distress." The report is compiled using data from the National Center for Health Statistics. Q: Should I encrypt passwords in-memory? When I use PHP in an application, and store hashed user credentials, should I store a password like so: \$password = sha1(\$password); Or, \$password = hash('sha1', \$password); How does the \$password = "0xf93983e0a313e317" differ from \$password = "0xf93983e0a313e317"? A: The above code produces the same result (in theory). \$password = sha1(\$password); is a shorthand for: \$password = hash('sha1', \$password); Q: How to use multiple spring beans in one method on time? I have spring mvc application that uses two different spring beans. I need to access both of them in one method. How to do that? I tried to mix first bean with second, but this didn't work properly (timeout error).
